

Ferric Phosphate Remover

Buckeye provides ferric-based, aquarium phosphate remover in standard granular, and high capacity forms. Our high capacity product may remove up to twice the phosphate and therefore need to be replaced less often.

The phosphate remover is best used in an up-flow media reactor where tumbling or agitation of the product is minimized. The material should be rinsed in running water prior to use (use of purified water during rinsing is ideal). Avoid aggressive agitation or stirring while rinsing.

Suggested application:

| <u>Form</u> | <u>Initial Use</u> | <u>Continuing Use</u> |
|--------------------|-----------------------------|------------------------------|
| Granular | 1 Tablespoon per 50 gallons | 2+ Tablespoon per 50 gallons |
| High Capacity | 1 Tablespoon per 50 gallons | 2+ Tablespoon per 50 gallons |

As with all products that supplement or modify water chemistry in saltwater aquariums, begin use of this product slowly. Use approximately 1 Tablespoon per 50 gallons of total system volume for the first 4-6 weeks, and slowly increase to double that amount or more over the next 4 to 6 weeks. Replace media when phosphate levels in the aquarium begin to rise.
